SAPAA SIR Web App Admin Manual

The manual will cover the four main functions that the admins can perform in the SAPAA web app. In the current version, this includes the Admin Dashboard, Account Management, Site Management, and Form Management. Click on any section below to get started.

Table of Contents

Preface

- Navigating to the Admin Dashboard 2

Section 1 - Admin Dashboard

- Overview 3
- Dashboard Insights 3

- Generating Site Inspection Report PDFs 13

Section 4 - Form Management

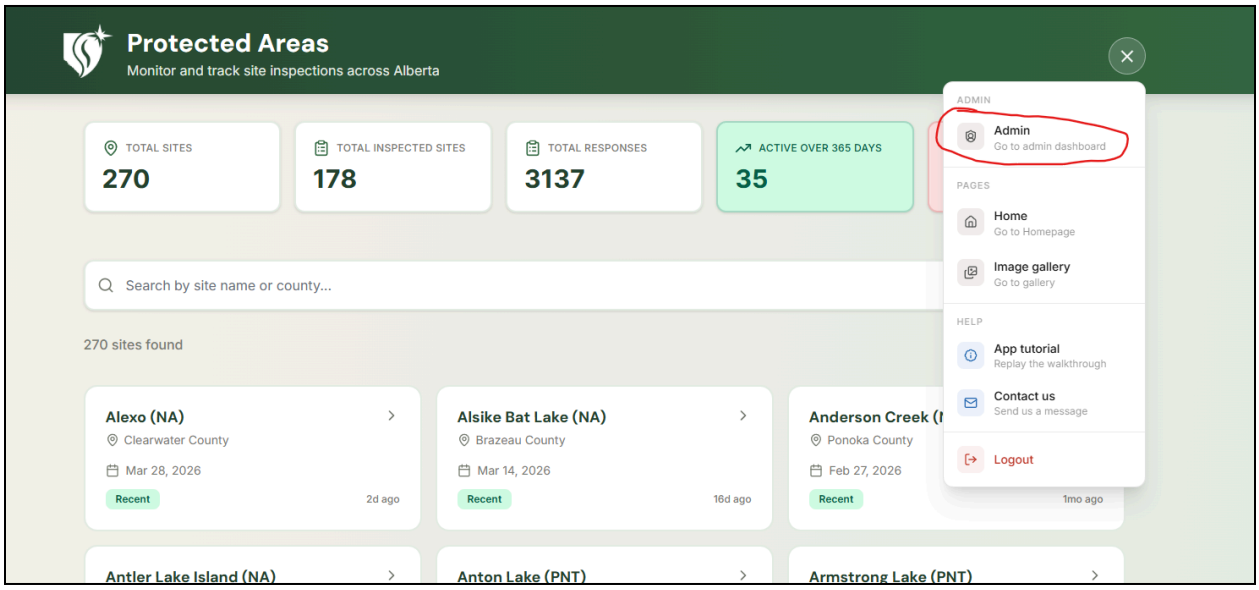

- Overview 16
- Adding New Questions 16
- Editing Questions 17

Preface

Navigating to the Admin Dashboard

The admin dashboard can be navigated to by clicking the menu button in the main screen of the web app. The admin button will only appear if you are a designated admin. This is currently the only way that the admin mode can be accessed.

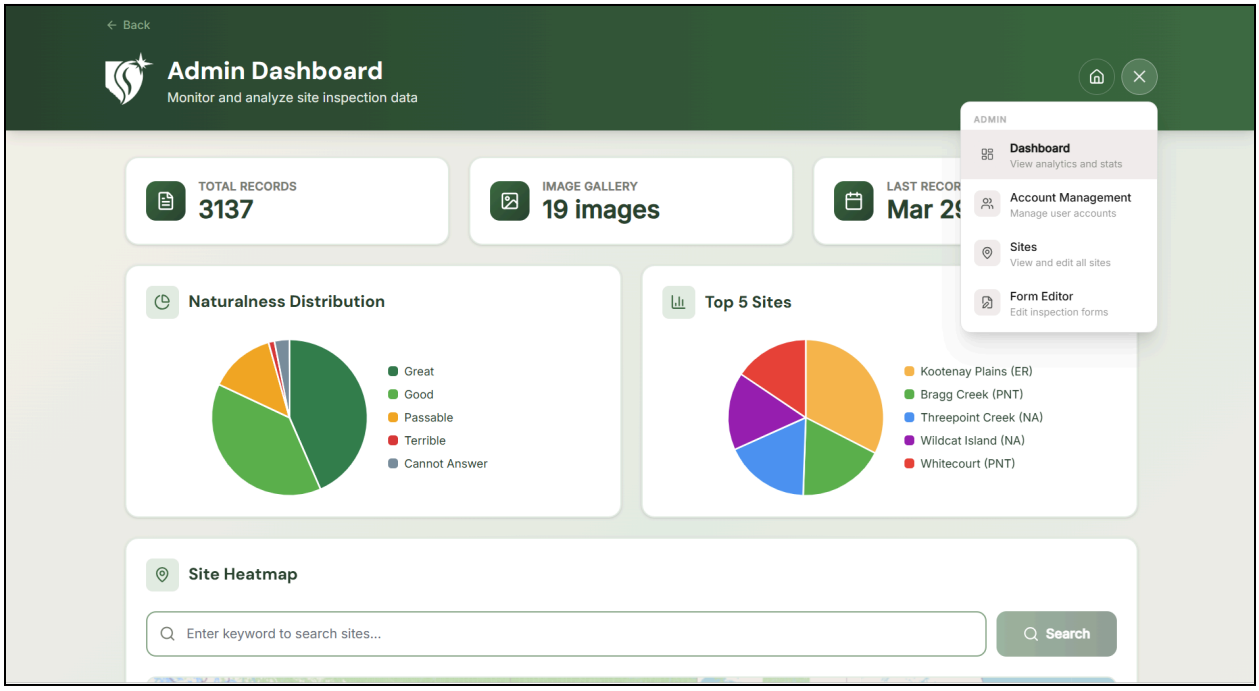

See the photo below.

Admin Dashboard

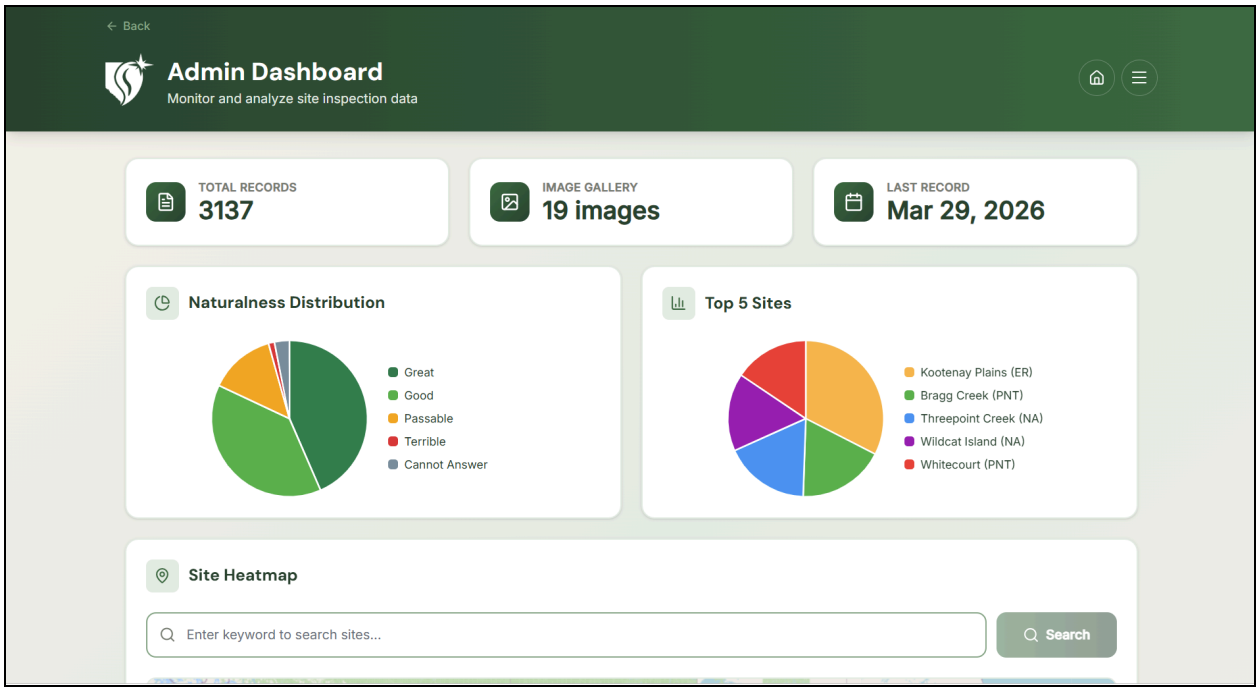

Overview

The admin dashboard is where the Admin is first directed to upon entering admin mode. The screen displays basic insight, a heatmap and a button to the admin image gallery. There is a menu button in the top right, which pops up the navigation menu for all of the other sections mentioned in this manual. Admin mode can easily be exited at any time by pressing the home icon right beside the menu button in the top right of the screen.

Dashboard Insights

As you first enter the admin screen, you will be met with some insights. You can easily keep track of how many records that you are keeping track of, when the most recent record was, the overall shape of all sites and the top 5 most visited sites. You will also see an image gallery, which we discussed here, as well as a heatmap, which we talked about here.

Heatmap

The heatmap shows a map of the world, with a layer on top that highlights the most visited sites. Providing circular overlays on the map that get bigger and warmer in colour as the activity increases.

NOTE: The heatmap takes a long time to load.

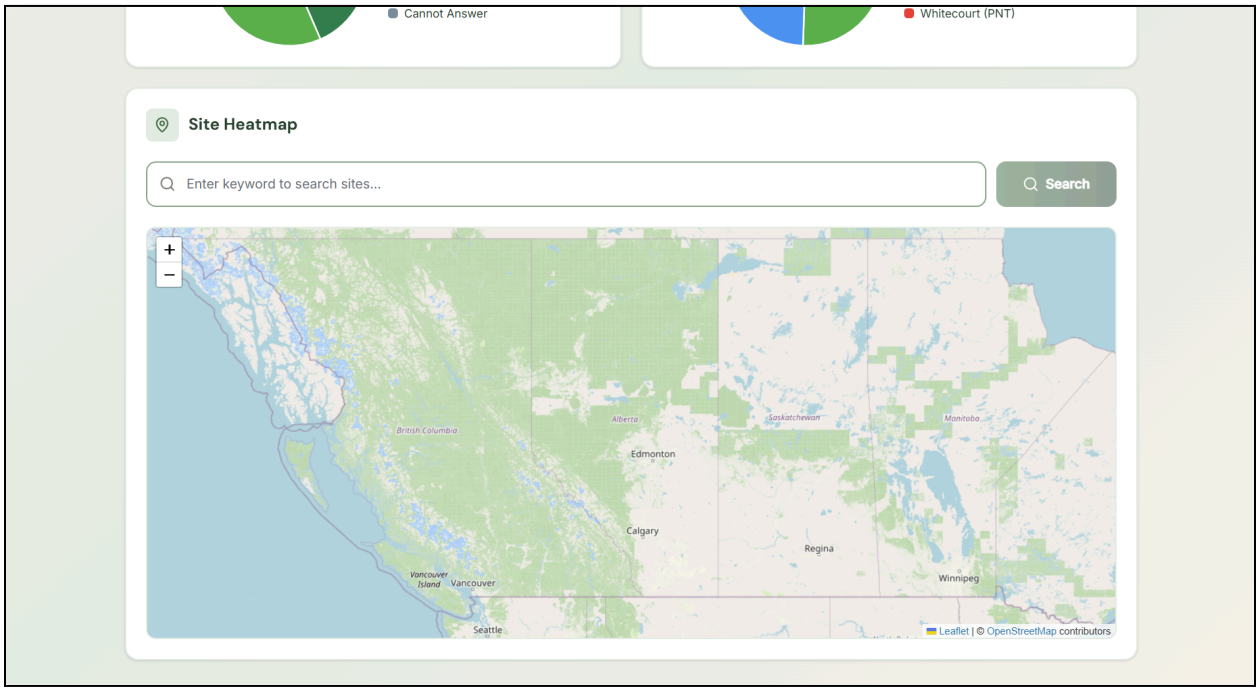

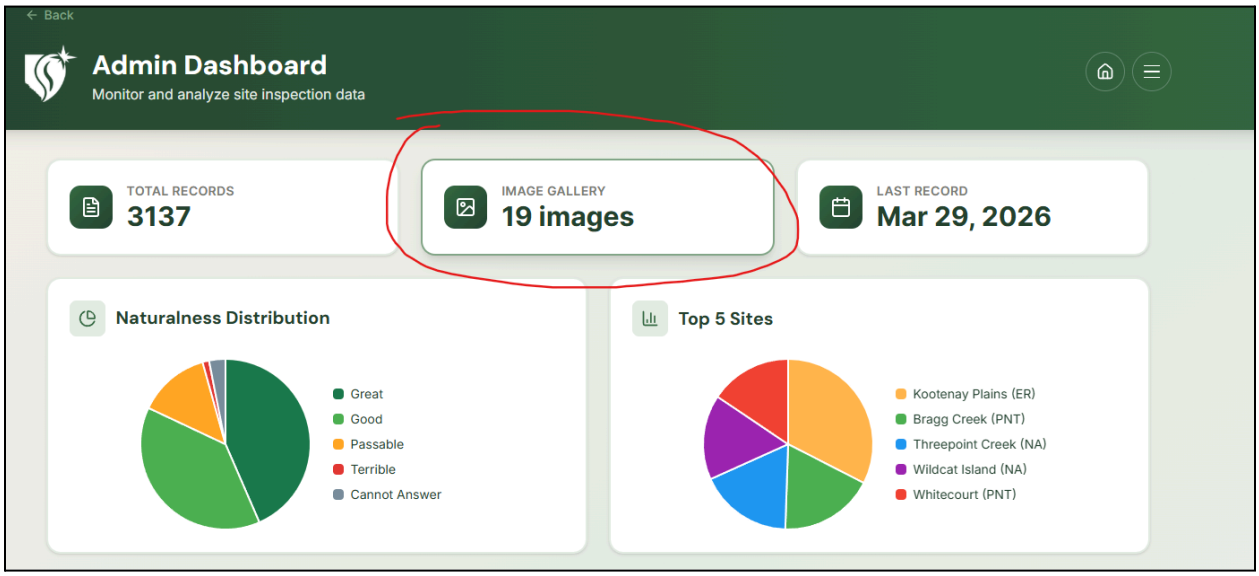

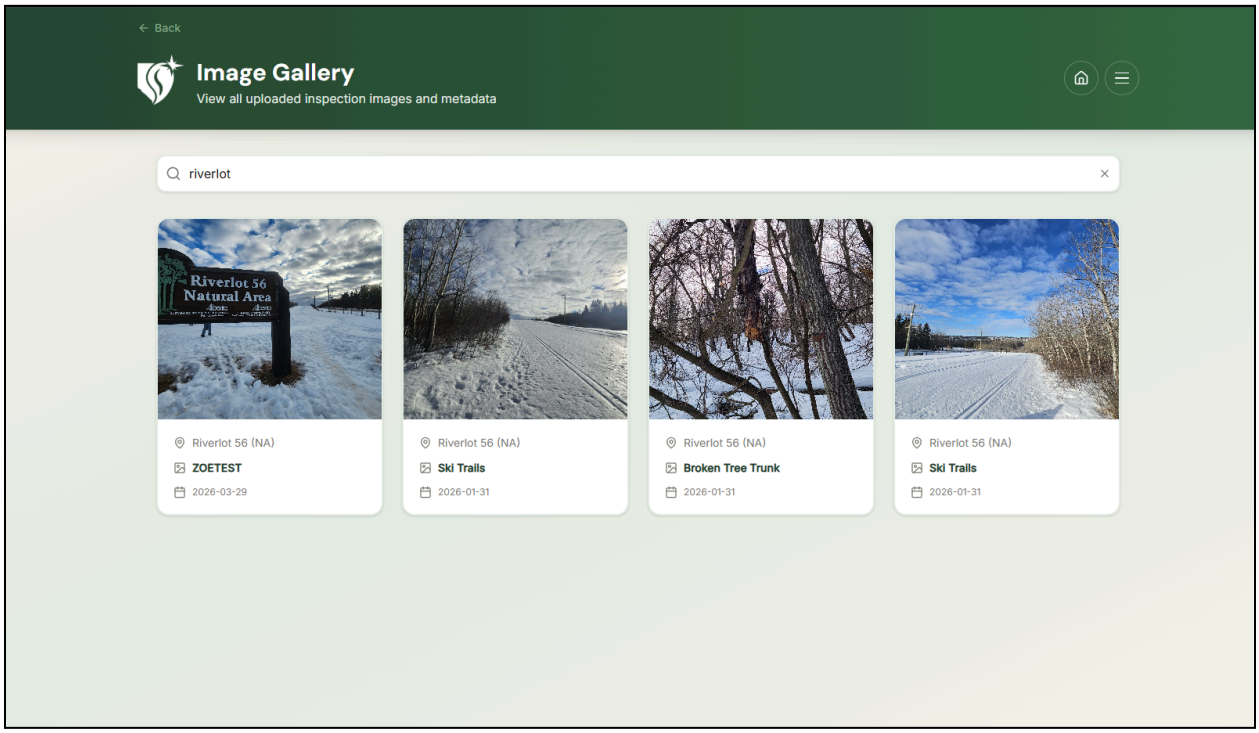

Image Gallery

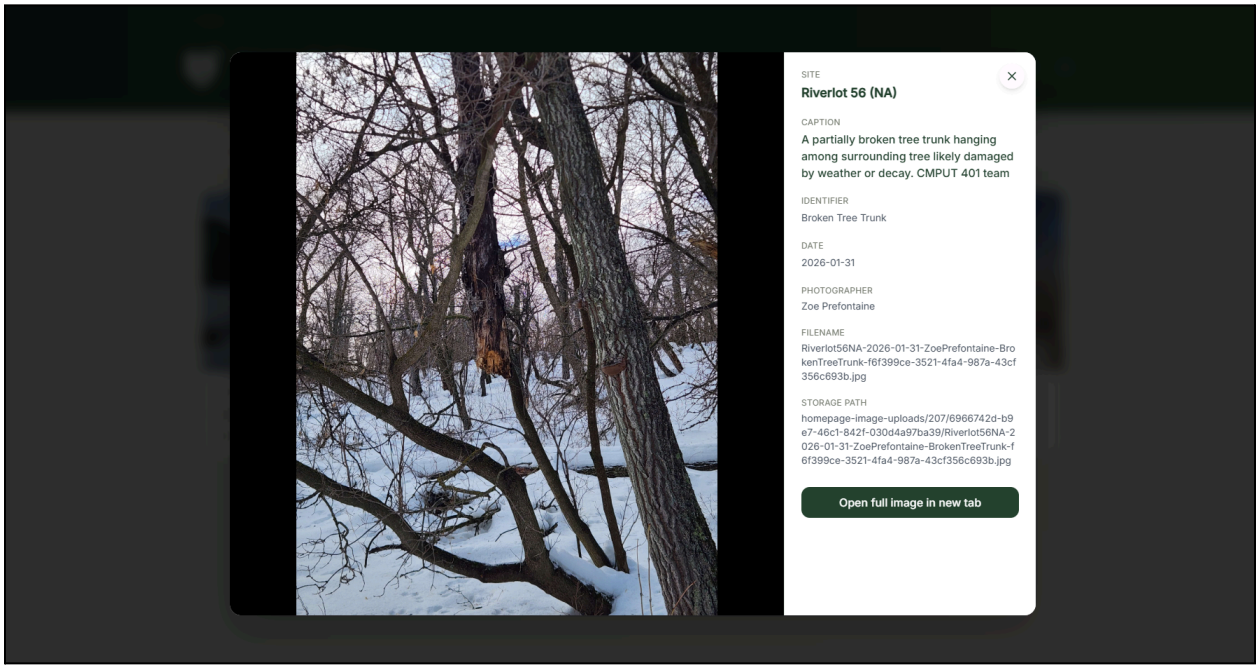

The image gallery allows the admin to see all of the images that have been uploaded to the website. All media is stored in AWS S3 and linked to a specific site with standardized metadata, making it easy to search and manage inspection photos. In this current version, the admin image gallery is very similar to the user image gallery except that it shows more image metadata when an image is clicked.

See next page for images.

After clicking on an image, you will see this screen, which shows you more details about the photo and allows you to open it in a new tab for better viewing and downloading.

Each image includes:

- File name
- Site (The site the image belongs to)
- Date (Date of inspection)
- Caption (Longer Description of the photo)
- Identifier (Short Description of the photo–tag for the image)
- Photographer (Person who captured the image)
- Storage Path (The exact path in AWS S3) [Admin only]

File Naming Convention

All uploaded image files follow a standardized naming convention (this is automatically generated by the system based on user input while uploading images):

SiteName-Date-Photographer-Identifier-UUID.extension

Example:
`ClydeFen-2025-01-23-BobSuruncle-ATVTrack-a1b2c3d4.jpg`

AWS S3 Storage

- All images are stored securely in AWS S3
- Each file has a unique storage key (path)

SIR upload path

`inspections/{siteId}/{responseId}/{questionId}/{generatedFilename}`

Example:
`inspections/207/3235/27/Riverlot56NA-2026-01-31-RaiyanaRahman-SkiTrails-aa05346a.jpg`

Standalone homepage upload path

`homepage-image-uploads/{siteId}/{userId}/{generatedFilename}`

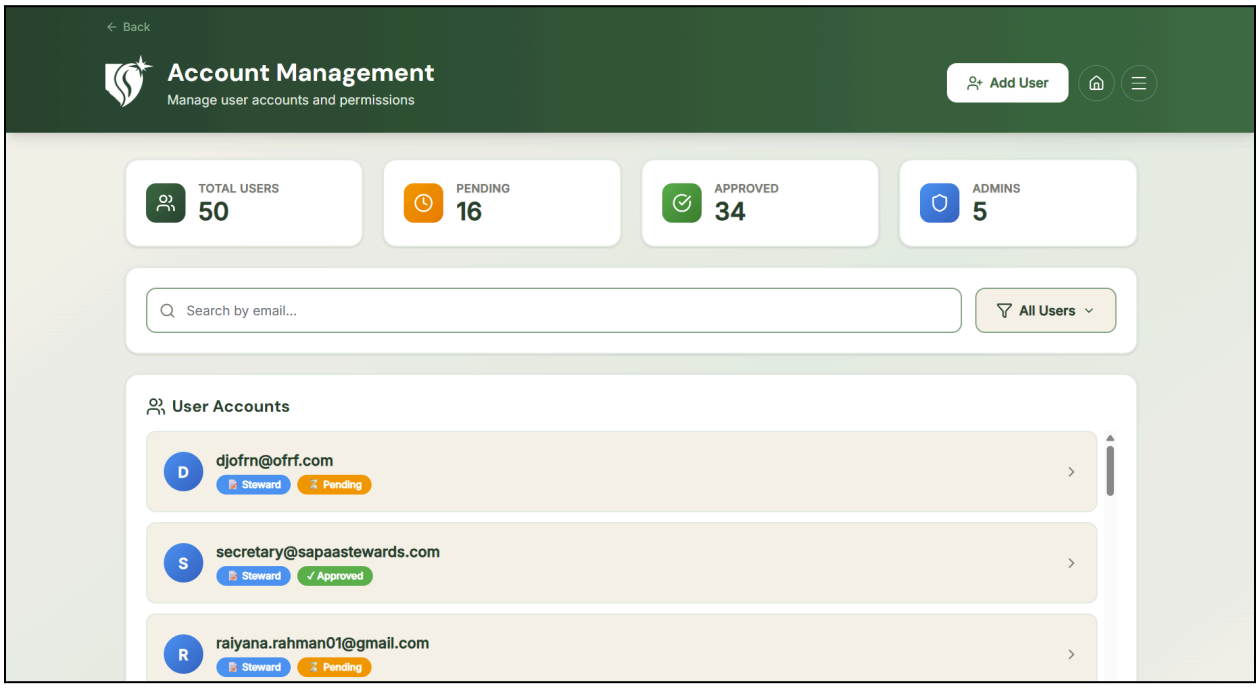

Example:
`homepage-image-uploads/207/6966742d-b9e7-46c1-842f-030d4a97ba39/Riverlot56NA-2026-01-31-ZoePrefontaine-BrokenTreeTrunk-f6f399ce-3521-4fa4-987a-43cf356c693b.jpg`

To delete images: To delete a specific image, you need to follow the path above inside AWS S3 and manually delete the image. This is a feature that will be implemented in the future.

Account Management

Overview

The account management screen allows you to easily control who has access to your app. In the current version, when a new user signs up, they are not given access. They are only given access upon Admin approval. You can also add and delete users as well as manage their roles. In case anyone forgets their password, you can easily reset it too.

Admin Account Insights

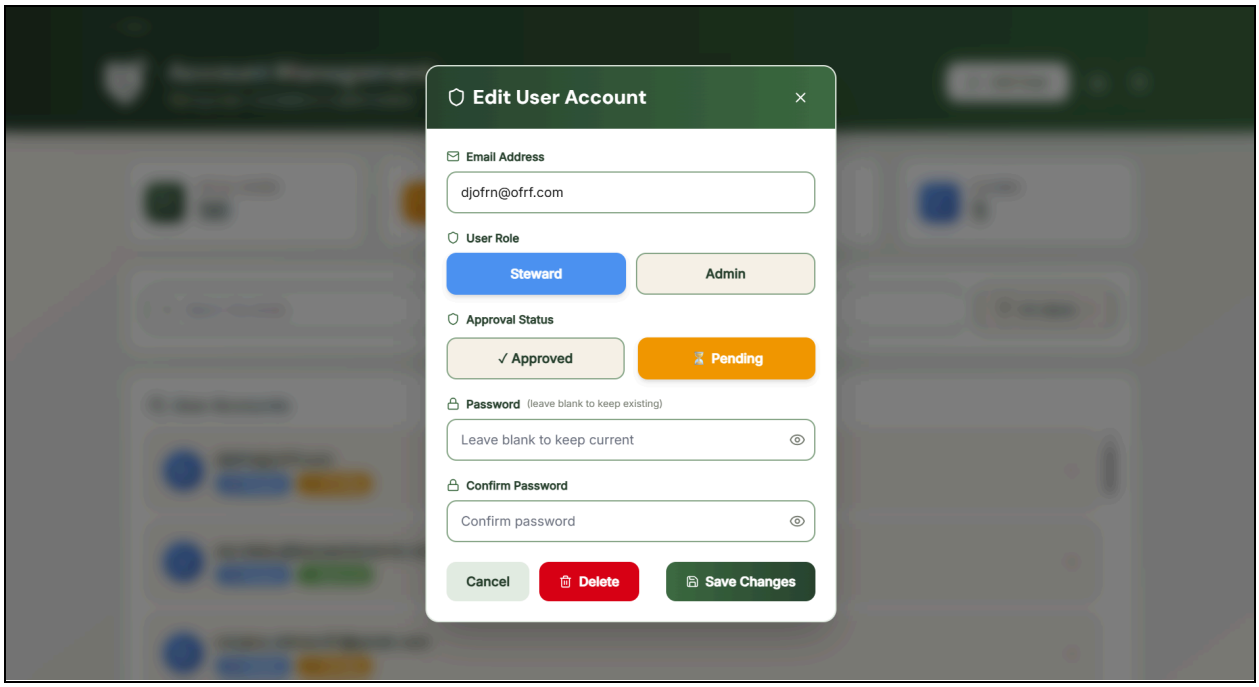

When first directed to the account management screen, you are met with the photo above. Features of this screen include seeing how many total users there are, how many users are pending your approval, how many approved users you have, and how many admins there are currently. You can also search users by email and filter them based on role, approval status, or alphabetically.

Please see the photo above.

Specific User Management

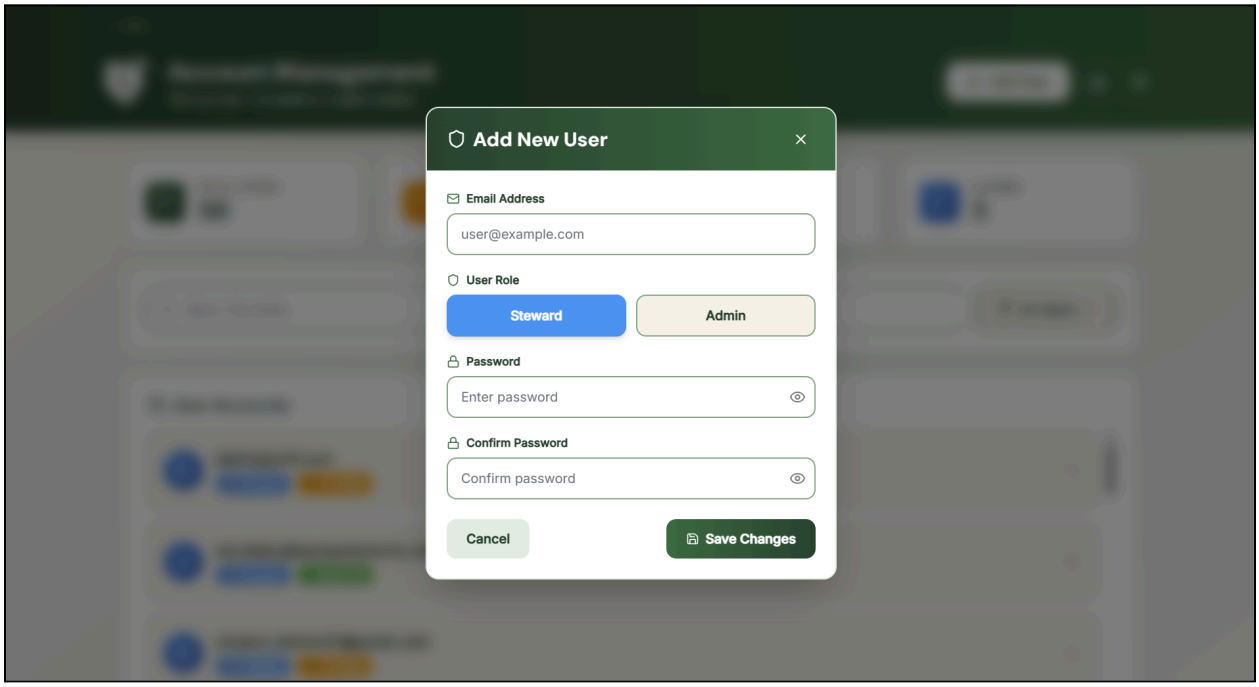

By clicking on a user, you can easily see information about their status. You have the ability to change their email address, modify their roles, change their approval status, change their password, and delete them as a user.

NOTE: You will not be able to see their password unless you reset it.

Adding a User

A user can also be added easily by clicking the add user button at the top right of the screen and providing their information, such as email address, role, and password.

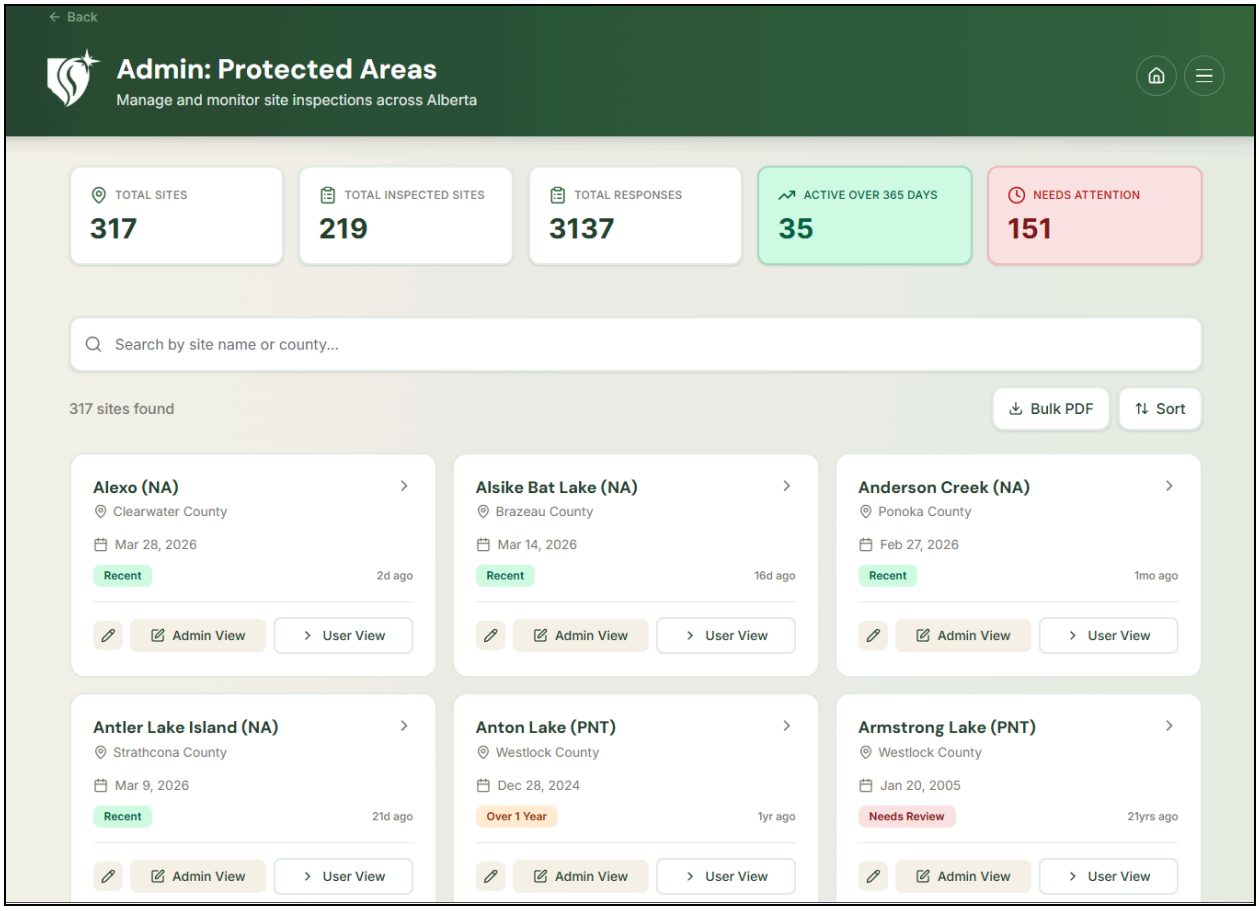

Site Management

Overview

Site management is accessed through the admin dashboard by clicking the “Sites” option. A list of all sites will be displayed. While this view is similar to the user site view, it shows all visible and disabled sites. Users will not be able to see the disabled sites.

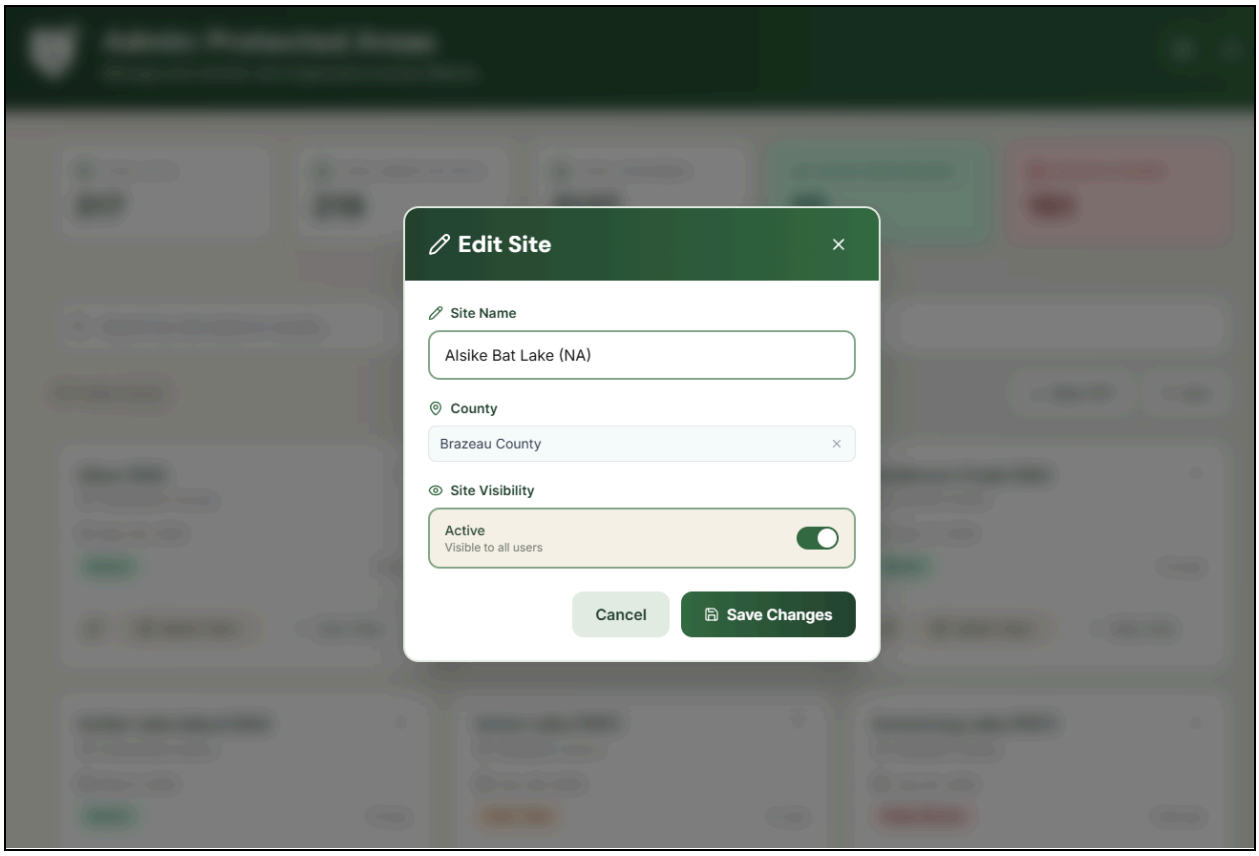

See image below for reference.

Editing a Site Profile

Clicking on the edit button (pencil icon) on any site card will open a pop-up showing the site’s basic details and allowing edits to the site’s name, county and visibility. Additionally, a site’s visibility can be disabled for users.

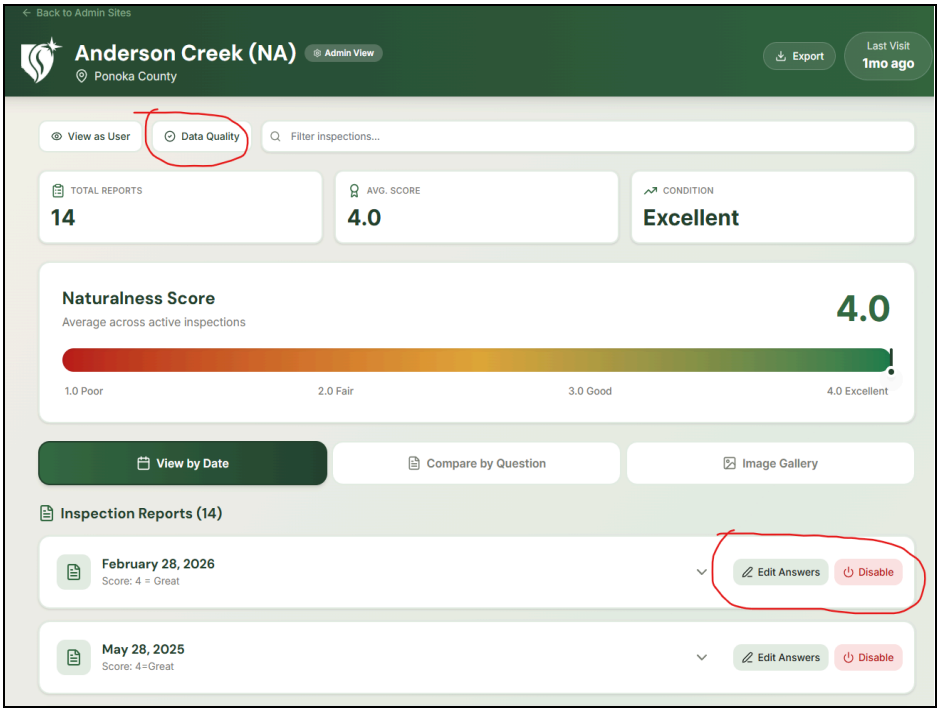

See image below.

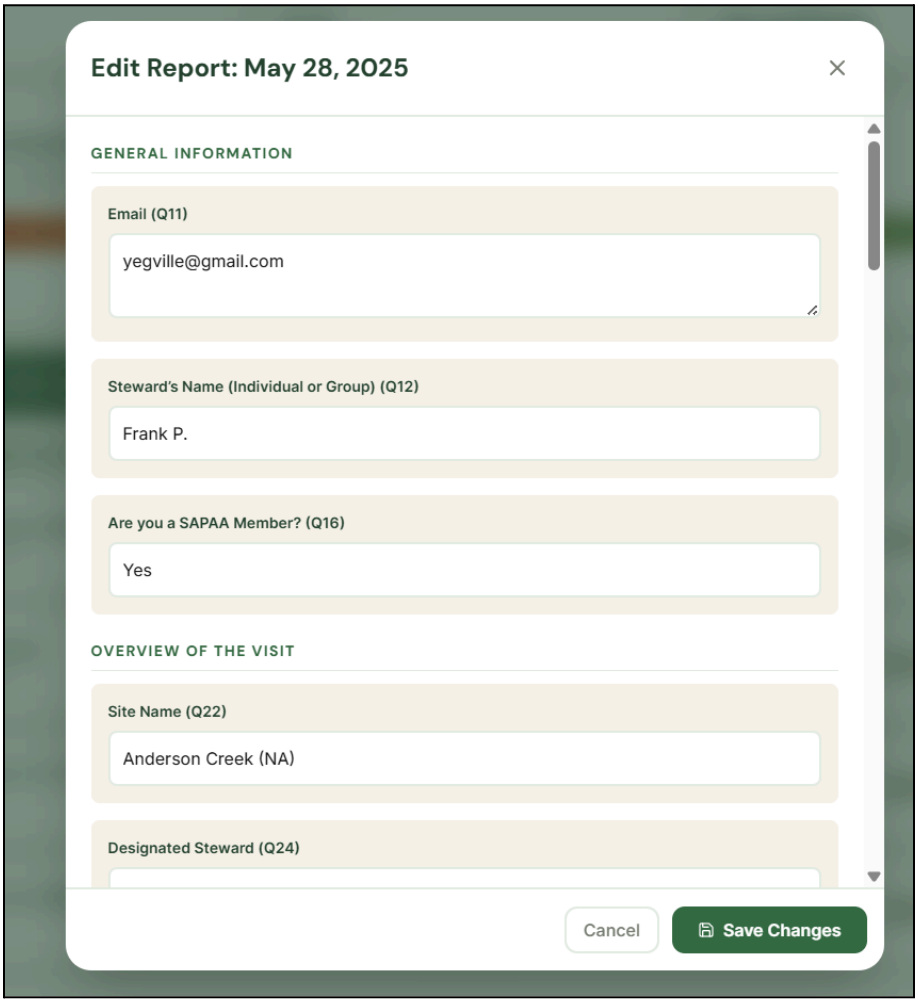

Managing Other Users' Site Inspection Reports

Clicking on the admin view button on any site will open up a special site detail page with more details for admins. This includes viewing the data quality compiled from all site inspection reports for this site and being able to see, edit, or disable other users' site inspection reports.

See images below.

Generating Site Inspection Report PDFs

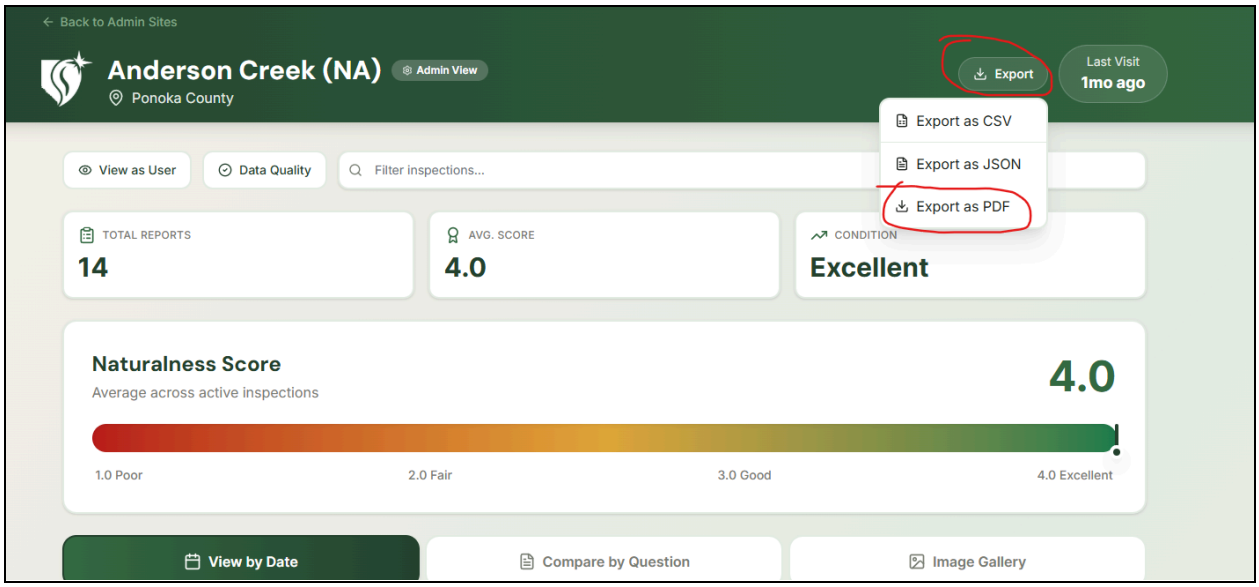

A bulk PDF can be generated by clicking the “Bulk PDF” button on the admin sites page. This shows a pop-up allowing customization of which sites to gather all site inspection data on, specifying a date range, including images, and much more.

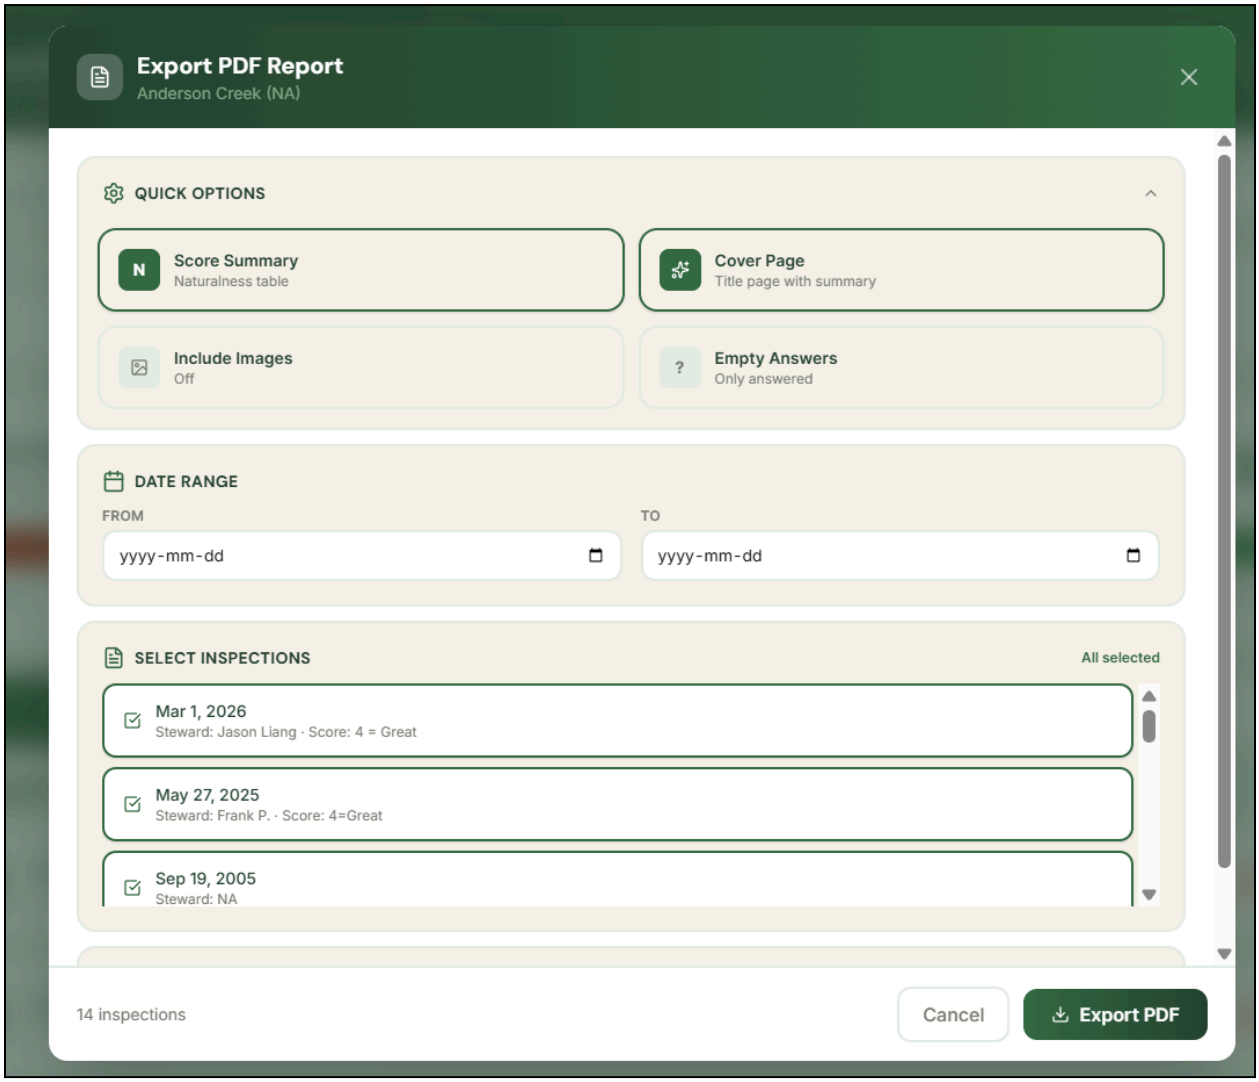

See the images below.

Alternatively, clicking on a specific site using the admin view button and clicking export as PDF will allow the generation of a PDF containing only certain site inspection reports in a particular site. See images below.

Form Management

Overview

Site Inspection Form management is accessed through the admin dashboard by clicking the “Form Editor” option. A new page will be displayed showing all the sections and questions in the current Site Inspection Form.

Adding New Questions

Click “Add Question” to fill out the details for adding a new question in the current selected section. Questions have to be filled out with a title, question key, type, required indicator, and optionally, description and predefined answer options. The question title and question key must also be in a specific format (e.g. Title: Question Test (Q70), Key: Q70_QuestionTest) to be accepted by the system. A live preview of the new question is shown on the right side of the page while editing. Once accepted, the question will be added to the current form section. See image below.

Editing Questions

Existing questions can be edited by clicking the pencil icon next to the question. These edits will appear on new and existing site inspection forms. Only the question title, description, required indicator, and answer options can be changed. Questions can also have their order moved around, or their visibility in the site inspection form toggled on and off. Use the touch pad on the left side of the question to drag and drop the question order, and use the eye icon on the right side to toggle visibility.

See images below.
